TWO-DIMENSIONAL WIND TUNNEL TEST OF AN OSCILLATING ROTOR AIRFOIL DATA REPORT

(Volume II)

by

L. U. Dadone Boeing Vertol Company

SUMMARY

An experimental investigation was conducted to determine the quasi-steady and unsteady characteristics of the NLR 7223-62 airfoil, an advanced section designed for helicopter rotor applications. The data were obtained with an airfoil model equipped with 17 differential transducers and mounted in the variable density test section of a blow-down wind tunnel. The test equipment and procedures were similar to other oscillating airfoil tests previously conducted in the same facility.

Quasi-steady pressure data were acquired at Mach numbers between M=0.2 and 0.9 with porous floor and ceiling (4.9% porosity). Drag data were acquired at a limited number of conditions with a wake-traversing probe. Static and oscillatory tests were then run with solid floor and ceiling at Mach numbers between M=0.2 and M=0.7.

The oscillatory test was run at frequencies from 23 Hz to approximately 90 Hz, with amplitudes of oscillation ranging from 2.5° to 10.0°. The test results are presented in two volumes. The first volume documents the test procedure and discusses some of the key results. The second volume is a data report and it contains tabulations of all static and oscillatory data.

LIST OF SYMBOLS

Computer Listing	Text	Description
AERO DAMP		symbol for $[2\pi^2 f_D(\Delta \alpha)^2]^{-1} \oint C_m d\alpha$, work-per-cycle coefficient
ALPHA	α	airfoil angle of attack, deg
ALPHA · NMAX		airfoil angle of attack at maximum value of normal force during a cycle of oscillation, deg

Computer Listing	Text	Description
ALPHA · 0	α_{\bullet}	mean angle of attack during oscilla- tion cycle, deg
	С	airfoil chord, m
	Cd	airfoil drag coefficient (drag force/unit span)/ $q_\infty c$
CM	Cm	airfoil pitching-moment coefficient, (pitching moment/unit span)/ $q_{\infty}c^2$
CM(MIN)		maximum magnitude of pitching-moment coefficient attained during oscillation
CN	Cn	airfoil normal force coefficient, (normal force/unit span)/ $q_{\infty}c$
CN (MAX)		maximum magnitude of normal-force coefficient attained during oscillation
DCP	ΔCp	differential pressure coefficient, $\Delta P/q_{\infty}$
DEL·ALPHA	Δα	amplitude of pitching motion, deg
DRIVE HZ	fp	<pre>drive frequency of airfoil motion in pitch, Hertz</pre>
к	k	reduced frequency, Tfc/V
MACH NO.	М	Mach number
n PHI		computer symbol for phase lead of response with respect to forcing motion for the nth harmonic, deg
	PT	tunnel test section total pressure, $N/m^2 (lb/in^2)$
Q	q	dynamic pressure, defined as $\frac{1}{2}\rho V^2$, N/m^2 (lb/ft ²)
RES n		magnitude of resultant for the nth harmonic
RN	Rn	Reynolds number based on airfoil chord

Computer Listing	Text	Description
TDR		ratio of the work-per-cycle coeffi- cient to the theoretical value
TP		test point identification
v		tunnel velocity, m/sec (ft/sec)
X/C	x/c	chordwise position, measured from the leading edge as a fraction of the chord
